Candidate's Details Automation

A recruitment Company wants to recruit some software developers for their client. They have a job portal/website from where they search for their desired candidates. They need to enter the skills or keywords on the portal and search for the candidates. Suppose their search results into 100s of candidates (one result in one page). It's very difficult for them to open each profile and extract the details of the candidates manually. Another hectic work is to type those details on an excel sheet. It's time taking and inefficient.

The Company wants to implement an automation system using RPA, that would solve their problem.

Help the Company by creating an automation system using UiPath that would do the following:

- Go to the website : www.fakenamegenerator.com
- Select the candidate's name, contact number and DOB, one by one
- Collect the information of all the candidates and put it into an excel sheet
- Mail the excel sheet to the manager
